

Lab Exercise 5- Generate and Use SSH Key with Git and GitHub

Objective:

To learn how to generate an SSH key, add it to GitHub, and use it to securely connect and push code without repeatedly entering a password.

Prerequisites

- Git installed on your local machine
 - GitHub account
 - Basic understanding of Git commands
-

Step 1 – Check for Existing SSH Keys

Run:

```
ls -al ~/.ssh
```

Look for files like `id_rsa` and `id_rsa.pub`. If they exist, you may already have an SSH key.

Step 2 – Generate a New SSH Key

Run:

```
ssh-keygen -t rsa -b 4096 -C "your_email@example.com"
```

- **-t rsa** → key type
- **-b 4096** → key length
- **-C** → comment (your GitHub email)

When prompted:

- Press **Enter** to save in the default location: /home/user/.ssh/id_rsa (Linux/Mac)
or C:\Users\<username>\.ssh\id_rsa (Windows)
 - Optionally, set a passphrase for extra security.
-

Step 3 – Start the SSH Agent

```
eval "$(ssh-agent -s)"
```

Step 4 – Add SSH Key to the Agent

```
ssh-add ~/.ssh/id_rsa
```

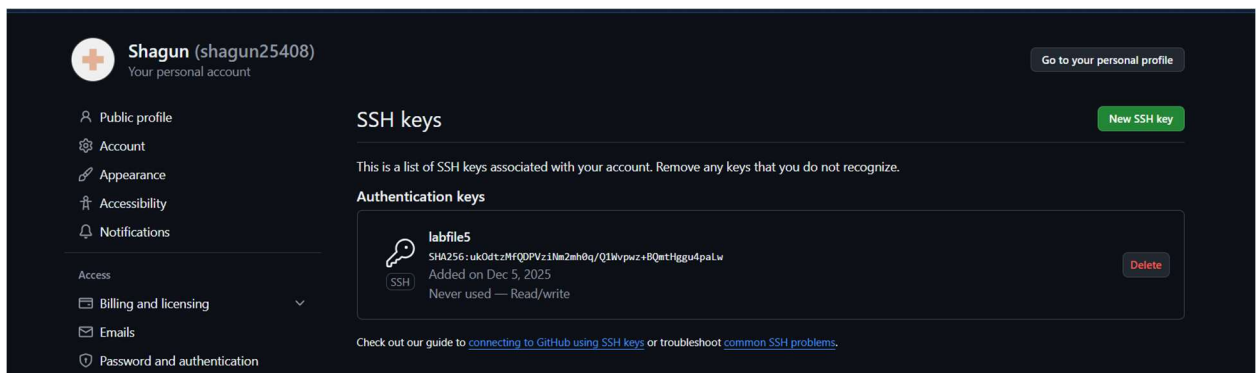

Step 5 – Add SSH Key to GitHub

1. Copy the public key:

```
cat ~/.ssh/id_rsa.pub
```

2. Log in to GitHub → **Settings** → **SSH and GPG Keys** → **New SSH key**.

3. Paste the key and save.

Step 6 – Test SSH Connection

```
ssh -T git@github.com
```

Output:

```
Hi shagun25408! You've successfully authenticated, but GitHub does not provide shell access.
```

Step 7 – Use SSH to Clone a Repository

```
shagu@shagun MINGW64 ~  
$ git clone https://github.com/shagun25408/labfile3.git  
Cloning into 'labfile3'...  
remote: Enumerating objects: 9, done.  
remote: Counting objects: 100% (9/9), done.  
remote: Compressing objects: 100% (5/5), done.  
remote: Total 9 (delta 1), reused 9 (delta 1), pack-reused 0 (from 0)  
Receiving objects: 100% (9/9), done.  
Resolving deltas: 100% (1/1), done.
```

Now you can pull and push without entering your username/password.

Use Case

Scenario:

An organization's developers often need to push code to GitHub multiple times a day. Using SSH keys eliminates the need to repeatedly enter credentials, while maintaining secure, encrypted communication between the developer's machine and GitHub.

Table – HTTPS vs SSH for GitHub

Feature	HTTPS	SSH
Authentication	Username & password / token	SSH key pair
Convenience	Requires login each session	No password once key is added
Security	Encrypted, but password-based auth	Encrypted, key-based authentication

Feature	HTTPS	SSH
Best For	Occasional access	Frequent development work
